

What do I want to learn or understand better?

I have now started to understand how the different applications are linked and want to code a functionality who has connections to the frontend, backend as well as the database.

How can I help someone else, or the entire team, to learn something new?

I am still not afraid to ask “stupid” questions! The programming process slows down when people with knowledge takes time to explain to me. This helps everyone involved in the coding process, since i might ask questions other might not know and the programmer who understands the issue needs to explain it, possibly increasing his understanding of the system itself. This week I have also started to write code with help of my fellow teammates, which made me have to understand every line of code written, hopefully making my teammates ability to teach and explain greater.

What is my contribution towards the team’s use of Scrum?

Following this week i have taken a more administrative role, making myself responsible for structuring meetings, writing agendas, driving the meeting forward as well as be a positive force to remind about deadlines, which we havenot been to good to follow.

What is my contribution towards the team’s deliveries?

Having the administrative role as well as being responsible for the team reflection, including being the president of that meeting, I managed to get deadlines in order. Regarding contribution codewise, I have instead of writing code been a critical eye for how the code was implemented.
